Listing of Claims

1. (Withdrawn) A method for threshold selection in analysis of an image having a plurality of pixels and an associated plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the method comprising the steps of:
- 5 identifying a number of peak values from the plurality of values;
- calculating an average peak value from the identified peak values derived in the previous step; and
- 10 calculating a threshold according to the average peak value, the number of identified peak values, and a predetermined number of false alarms.
2. (Withdrawn) The method of Claim 1, wherein the step of identifying a peak value from a plurality of values further comprises:
- 5 identifying and storing a peak value from the plurality of values;
- identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
- bounding an area around the location of the identified pixel according to a predetermined scheme;
- 10 excluding from further processing each pixel in the plurality of pixels within the bounded area and the value in the plurality of values associated therewith; and
- repeating the prior steps until the peak value is less than or equal to an insignificant value.
3. (Withdrawn) The method of Claim 2, wherein the predetermined scheme further comprises an area corresponding in size to the area of a known target image.
4. (Withdrawn) The method of Claim 2, wherein the insignificant value is determined according to a system noise calculation.
5. (Withdrawn) The method of Claim 2, wherein the insignificant value is determined according to theoretical prediction.
6. (Withdrawn) The method of Claim 1, wherein the step of calculating the threshold further comprises steps of:
- (a) calculating a number of objects having values exceeding the threshold;
- 5 (b) identifying a highest peak value in the determined peak values;
- (c) excluding from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;
- 10 (d) calculating a new threshold based on the new peak average;

10/637,080

(e) calculating a new number of objects having values exceeding the new average peak value; and

- 15 (f) if the new number of objects is greater than the number of objects, then replacing the number of objects with the new number of objects and repeating steps (c), (d), (e) and (f) until the new number of objects remains constant in value.

7. (Original) A method for threshold selection in analysis of an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the method
5 comprising steps of:

- (a) identifying and storing a peak value from the plurality of values;
(b) identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the
10 identified pixel;
(c) bounding an area around the location of the identified pixel, the area corresponding in size to an area of a known target image;
(d) excluding from further processing each pixel within the
15 bounded area and the value associated therewith;
(e) repeating steps (a) through (d) until the peak value is less than or equal to an insignificant value;
(f) calculating an average peak value from the stored peak values;
20 (g) calculating a threshold according to the average peak value;
(h) calculating a number of objects having values exceeding the threshold;
(i) identifying a highest peak value in the determined peak
25 values;
(j) excluding from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;
(k) calculating a new threshold based on the new peak
30 average;
(l) calculating a new number of objects having values exceeding the new average peak value; and
(m) if the new number of objects is greater than the number of objects, then replacing the number of objects with the new
35 number of objects and repeating steps (j), (k), (l), and (m) until the new number of objects remains constant in value.

8. (Original) The method of Claim 7, wherein the insignificant value is determined according to a system noise calculation, the system noise calculation comprising steps of:
5 determining a brightness range;
selecting a highest value of the brightness range;
determining a subject noise percentage; and
calculating the insignificant value according to the subject noise percentage of the highest value of the brightness range.

10/637,080

9. (Original) The method of Claim 7, wherein the insignificant value is determined according to theoretical prediction comprising steps of:

- 5 determining theoretical output of values according to an F-distribution;
- determining an exponential distribution of values; and
- calculating the insignificant value according to a value representing a match between the exponential distribution and the theoretical output.

10. (Original) The method of Claim 7, wherein the step of calculating the threshold further comprises a formula:

$$T = -\mu \ln(K/N),$$

- 5 wherein T represents the threshold, μ represents the average peak value, K represents the predetermined number of false alarms, and N represents the number of identified peak values.

11. (Original) The method of Claim 7, wherein the step of calculating the new threshold based on the new peak average further comprises a formula:

$$\hat{T} = -\hat{\mu} \ln(K/N),$$

- 5 wherein \hat{T} is the updated threshold, $\hat{\mu}$ is the new average value, N is the new number of objects, and K is the predetermined number of false alarms.

12. (Original) A method of recognizing a target in an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the method comprising steps of:

- 5 (a) identifying and storing a peak value from the plurality of values;
- (b) identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
- 10 (c) bounding an area around the location of the identified pixel, the area corresponding in size to an area of a known target image;
- (d) excluding from further processing each pixel within the bounded area and the value associated therewith;
- 15 (e) repeating steps (a) through (d) until the peak value is less than or equal to an insignificant value;
- (f) calculating an average peak value from the stored peak values;
- 20 (g) calculating a threshold according to the formula:

$$T = -\mu \ln(K/N),$$
 wherein T represents the threshold, μ represents the average peak value, K represents the predetermined number of false alarms, and N represents the number of identified peak values;

10/637,080

- 25 (h) calculating a number of objects having values exceeding the threshold;
- (i) identifying a highest peak value in the determined peak values;
- (j) excluding from further processing the current highest peak value, calculating a new average peak value derived from
- 30 the remaining identified peak values;
- (k) calculating a new threshold according to the formula:

$$\hat{T} = -\hat{\mu} \ln(K/N),$$

- 35 wherein \hat{T} is the updated threshold, $\hat{\mu}$ is the new average value, N is the new number of objects, and K is the predetermined number of false alarms;

- (l) calculating a new number of objects having values exceeding the new average peak value; and
- (m) if the new number of objects is greater than the number
- 40 of objects, then replacing the number of objects with the new number of objects and repeating steps (j), (k), (l) and (m) until the new number of objects remains constant in value.

13. (Original) A method of recognizing a target in an image, the method comprising steps of:

- (a) acquiring data;
- (b) converting the data to an image having a plurality of
- 5 pixels;
- (c) analyzing the plurality of pixels and assigning each pixel a respective value from a plurality of values;
- (d) identifying and storing a peak value from the plurality of values;
- 10 (e) identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
- (f) bounding an area around the location of the identified pixel, the area corresponding in size to an area of a known
- 15 target image;
- (g) excluding from further processing each pixel within the bounded area and the value associated therewith;
- (h) repeating steps (d) through (g) until the peak value is less than or equal to an insignificant value;
- 20 (i) calculating an average peak value from the stored peak values;
- (j) calculating a threshold according to the average peak value;
- (k) calculating a number of objects having values exceeding
- 25 the threshold;
- (l) identifying a highest peak value in the determined peak values;
- (m) excluding from further processing the current highest peak value and calculating a new average peak value derived from
- 30 the remaining identified peak values;
- (n) calculating a new threshold based on the new peak average;

10/637,080

(o) calculating a new number of objects having values exceeding the new average peak value; and

- 35 (p) if the new number of objects is greater than the number of objects, then replacing the number of objects with the new number of objects and repeating steps (m), (n), (o) and (p) until the new number of objects remains constant in value.

14. (Withdrawn) A system for threshold selection in analysis of an image having a plurality of pixels and an associated plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the system comprising:

5 a storage medium for storing the image and the plurality of values;

a peak value generator for identifying a number of peak values from the plurality of values; and

- 10 a calculator for calculating an average peak value from the identified peak values derived in the previous step and calculating the threshold according to the average peak value, the number of identified peak values, and a predetermined number of false alarms.

15. (Withdrawn) The system of Claim 14, wherein the peak value generator further comprises:

5 an identifier and storage unit for identifying and storing a peak value from the plurality of values and identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel; an area determinator for bounding an area around the location of the identified pixel according to a predetermined scheme; and

- 10 a comparison and repeater module for excluding from further processing each pixel in the plurality of pixels within the bounded area and the value in the plurality of values associated therewith and invoking the identifier and storage unit and area determinator until the peak value is less than or equal to an insignificant value.

16. (Withdrawn) The system of Claim 15, wherein the predetermined scheme further comprises an area corresponding in size to the area of a known target image.

17. (Withdrawn) The system of Claim 15, wherein the insignificant value is determined according to a system noise calculation.

18. (Withdrawn) The system of Claim 15, wherein the insignificant value is determined according to theoretical prediction.

19. (Withdrawn) The system of Claim 14, wherein the calculator further comprises steps of:

(a) calculating a number of objects having values exceeding the threshold;

10/637,080

- 5 (b) identifying a highest peak value in the determined peak values;
(c) excluding from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;
10 (d) calculating a new threshold based on the new peak average;
(e) calculating a new number of objects having values exceeding the new average peak value; and
(f) if the new number of objects is greater than the number
15 of objects, then replacing the number of objects with the new number of objects and repeating steps (c), (d), (e) and (f) until the new number of objects remains constant in value.

20. (Original) A system for target recognition in an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the system comprising:

- 5 a storage medium for storing the image and the plurality of values;
a peak value generator for identifying a number of peak values from the plurality of values, the peak value generator comprising:
10 an identifier and storage unit for identifying and storing a peak value from the plurality of values and identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
an area determinator for bounding an area
15 around the location of the identified pixel, the area corresponding in size to the area of a known target image; and
a comparison and repeater module for excluding from further processing each pixel in the plurality of pixels within the bounded area and the value in the plurality of values
20 associated therewith and invoking the identifier and storage unit and area determinator until the peak value is less than or equal to an insignificant value; and
a calculator for calculating an average peak value from the identified peak values derived in the previous step and
25 calculating a threshold according to the average peak value; the number of identified peak values; and a predetermined number of false alarms.

21. (Original) The system of Claim 20, wherein the insignificant value further is determined according to a system noise calculation, the system noise calculation comprising steps of:

- 5 determining a brightness range;
selecting a highest value of the brightness range;
determining a subject noise percentage; and
calculating the insignificant value according to the subject noise percentage of the highest value of the brightness range.

10/637,080

22. (Original) The system of Claim 20, wherein the insignificant value is determined according to theoretical prediction comprising steps of:

- 5 determining theoretical output of values according to an F-distribution;
- determining an exponential distribution of values; and
- calculating the insignificant value according to a value representing a match between the exponential distribution and the theoretical output.

23. (Original) The system of Claim 20, wherein calculating the threshold further comprises a formula:

$$T = -\mu \ln(K/N),$$

- 5 wherein T represents the threshold, μ represents the average peak value, K represents the predetermined number of false alarms, and N represents the number of identified peak values.

24. (Original) The system of Claim 20, wherein calculating the new threshold based on the new peak average further comprises a formula:

$$\hat{T} = -\hat{\mu} \ln(K/N),$$

- 5 wherein \hat{T} is the updated threshold, $\hat{\mu}$ is the new average value, N is the new number of objects, and K is the predetermined number of false alarms.

25. (Withdrawn) A system for target recognition in an image, the system comprising:

- 5 a database having at least one known target image;
 - an image having a plurality of pixels;
 - a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels;
- 10 a storage medium for storing the image and the plurality of values;
- a peak value generator for identifying a number of peak values from the plurality of values, each peak value in the number of peak values corresponding to an area of the image equivalent to an area of the at least one known target image; and
- 15 a calculator for calculating an average peak value from the identified peak values derived in the previous step and calculating a threshold according to the average peak value; the number of identified peak values; and a predetermined number of false alarms.

- 26. (Withdrawn) A computer system for threshold selection in analysis of an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the system
 - 5 comprising:

10/637,080

a memory coupled to a processor, the processor operable to process the plurality of values;

identify a number of peak values from the plurality of values;

10 calculate an average peak value from the identified peak values derived in the previous step; and

calculate a threshold according to the average peak value, the number of identified peak values, and a predetermined number of false alarms.

27. (Withdrawn) The computer system of Claim 26, wherein the step of identifying a peak value from a plurality of values further comprises:

5 identifying and storing a peak value from the plurality of values;

identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;

bounding an area around the location of the identified pixel according to a predetermined scheme;

10 excluding from further processing each pixel in the plurality of pixels within the bounded area and the value in the plurality of values associated therewith; and

repeating the prior steps until the peak value is less than or equal to an insignificant value.

28. (Withdrawn) The computer system of Claim 27, wherein the predetermined scheme further comprises an area corresponding in size to the area of a known target image.

29. (Withdrawn) The computer system of Claim 27, wherein the insignificant value is determined according to a system noise calculation.

30. (Withdrawn) The computer system of Claim 27, wherein the insignificant value is determined according to theoretical prediction.

31. (Withdrawn) The computer system of Claim 26, wherein the processor is further operable to:

(a) calculate a number of objects having values exceeding the threshold;

5 (b) identify a highest peak value in the determined peak values;

(c) exclude from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;

10 (d) calculate a new threshold based on the new peak average;

(e) calculate a new number of objects having values exceeding the new average peak value; and

15 (f) if the new number of objects is greater than the number of objects, then replace the number of objects with the new number of objects and repeat steps (c), (d), (e) and (f) until the new number of objects remains constant in value.

10/637,080

32. (Withdrawn) A computer readable medium for threshold selection in analysis of an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the computer readable medium comprising:

- 5 a code segment for identifying a number of peak values from the plurality of values;
- a code segment for calculating an average peak value from the identified peak values derived in the previous step; and
- 10 a code segment for calculating a threshold according to the average peak value, the number of identified peak values, and a predetermined number of false alarms.

33. (Withdrawn) The computer readable medium of Claim 32, further comprising:

- a code segment for identifying and storing a peak value from the plurality of values;
- 5 a code segment for identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
- a code segment for bounding an area around the location of the identified pixel according to a predetermined scheme;
- 10 a code segment for excluding from further processing each pixel in the plurality of pixels within the bounded area and the value in the plurality of values associated therewith; and
- a code segment for repeating the prior steps until the peak value is less than or equal to an insignificant value.

34. (Withdrawn) The computer readable medium of Claim 33, wherein the predetermined scheme further comprises an area corresponding in size to the area of a known target image.

35. (Withdrawn) The computer readable medium of Claim 33, wherein the insignificant value is determined according to a system noise calculation.

36. (Withdrawn) The computer readable medium of Claim 33, wherein the insignificant value is determined according to theoretical prediction.

37. (Withdrawn) The computer readable medium of Claim 32, further comprising:

- (a) a code segment for calculating a number of objects having values exceeding the threshold;
- 5 (b) a code segment for identifying a highest peak value in the determined peak values;
- (c) a code segment for excluding from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;
- 10 (d) a code segment for calculating a new threshold based on the new peak average;
- (e) a code segment for calculating a new number of objects having values exceeding the new average peak value; and

10/637,080

- 15 (f) a code segment for determining if the new number of objects is greater than the number of objects, and, if so, then replacing the number of objects with the new number of objects and repeating steps (c), (d), (e) and (f) until the new number of objects remains constant in value.

38. (Original) A computer system for threshold selection in analysis of an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the system
5 comprising:
a memory coupled to a processor, the processor operable to process the plurality of values;
(a) identify and storing a peak value from the plurality of values;
10 (b) identify a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
(c) bound an area around the location of the identified pixel, the area corresponding in size to an area of a known
15 target image;
(d) exclude from further processing each pixel within the bounded area and the value associated therewith;
(e) repeat functions (a) through (d) until the peak value is less than or equal to an insignificant value;
20 (f) calculate an average peak value from the stored peak values;
(g) calculate a threshold according to the average peak value;
(h) calculate a number of objects having values exceeding
25 the threshold;
(i) identify a highest peak value in the determined peak values;
(j) exclude from further processing the current highest peak value and calculating a new average peak value derived from the
30 remaining identified peak values;
(k) calculate a new threshold based on the new peak average;
(l) calculate a new number of objects having values exceeding the new average peak value; and
(m) if the new number of objects is greater than the number
35 of objects, then replace the number of objects with the new number of objects and repeat the previous four functions until the new number of objects remains constant in value.

39. (Original) The computer system of Claim 38, wherein the processor is further operable to:
determine a brightness range;
select a highest value of the brightness range;
5 determine a subject noise percentage; and
calculate the insignificant value according to the subject noise percentage of the highest value of the brightness range.

40. (Original) The computer system of Claim 38, wherein the processor is further operable to:

10/637,080

determine theoretical output of values according to an F-distribution;

- 5 determine an exponential distribution of values; and
 calculate the insignificant value according to a value representing a match between the exponential distribution and the theoretical output.

41. (Original) The computer system of Claim 38, wherein the processor is further operable to calculate the threshold according to a formula:

$$T = -\mu \ln(K/N),$$

- 5 wherein T represents the threshold, μ represents the average peak value, K represents the predetermined number of false alarms, and N represents the number of identified peak values.

42. (Original) The computer system of Claim 38, wherein the processor is further operable to calculate the new threshold based on the new peak average according to a formula:

$$\hat{T} = -\hat{\mu} \ln(K/N),$$

- 5 wherein \hat{T} is the updated threshold, $\hat{\mu}$ is the new average value, N is the new number of objects, and K is the predetermined number of false alarms.

43. (Original) A computer readable medium for threshold selection in analysis of an image having a plurality of pixels and a plurality of values, each value in the plurality of values corresponding to a respective pixel in the plurality of pixels, the computer readable medium comprising:

- 5 (a) a code segment for identifying and storing a peak value from the plurality of values;
 (b) a code segment for identifying a pixel in the plurality of pixels corresponding to the peak value and storing a location of the identified pixel;
 10 (c) a code segment for bounding an area around the location of the identified pixel, the area corresponding in size to an area of a known target image;
 (d) a code segment for excluding from further processing
 15 each pixel within the bounded area and the value associated therewith;
 (e) a code segment for invoking the code segment (a) through (d) until the peak value is less than or equal to an insignificant value;
 20 (f) a code segment for calculating an average peak value from the stored peak values;
 (g) a code segment for calculating a threshold according to the average peak value;
 25 (h) a code segment for calculating a number of objects having values exceeding the threshold;

10/637,080

- (i) a code segment for identifying a highest peak value in the determined peak values;
- 30 (j) a code segment for excluding from further processing the current highest peak value and calculating a new average peak value derived from the remaining identified peak values;
- (k) a code segment for calculating a new threshold based on the new peak average;
- (l) a code segment for calculating a new number of objects having values exceeding the new average peak value; and
- 35 (m) a code segment for determining if the new number of objects is greater than the number of objects, and, if so, then replacing the number of objects with the new number of objects and invoking code segments (j), (k), (l), and (m) until the new number of objects remains constant in value.

44. (Original) The computer readable medium of Claim 43, further comprising:

a code segment for determining a brightness range;

5 a code segment for selecting a highest value of the brightness range;

a code segment for determining a subject noise percentage; and

a code segment for calculating the insignificant value according to the subject noise percentage of the highest value of the brightness range.

10

45. (Original) The computer readable medium of Claim 43, further comprising:

a code segment for determining theoretical output of values according to an F-distribution;

5 a code segment for determining an exponential distribution of values; and

a code segment for calculating the insignificant value according to a value representing a match between the exponential distribution and the theoretical output.

10

46. (Original) The computer readable medium of Claim 43, further comprising a code segment for calculating the threshold according to a formula:

$$T = -\mu \ln(K/N),$$

5 wherein T represents the threshold, μ represents the average peak value, K represents the predetermined number of false alarms, and N represents the number of identified peak values.

10/637,080

47. (Original) The computer readable medium of Claim 43, further comprising a code segment for calculating the new threshold based on the new peak average according to a formula:

$$\hat{T} = -\hat{\mu} \ln(K/N),$$

- 5 wherein \hat{T} is the updated threshold, $\hat{\mu}$ is the new average value, N is the new number of objects, and K is the predetermined number of false alarms.
